receptor consist only of the extracellular portion of the receptor and are not glycosylated i.e. they do not have transmembrane domains or signal peptides. The recombinant proteins my be used in immunoassays to determine the immune status of patients with chronic diseases of the immune system, e.g. AIDS, systemic lupus erythematosus (SLE), multiple myeloma (MM), or rheumatoid arthritis. In addition, pharmaceutical
                                                                                                                                                                                                                                                                                             monocytes and macrophages, but expression can also be induced on neutrophils and eosinophils. Upon Fc receptor activation, immune effecto pathways are activated, leading to immune response. The present sequence
                                                                                                                                                                                                                                                                                                                                                                    role in defending the body against infections. First, pathogens are opsonised by serum immunoglobulins. The resulting complex then binds cells expressing Fc receptors. FcgammaRI molecules are expressed by
                                                 prevent autoimmune diseases, allergies or tumours, especially AIDS rheumatoid arthritis or MM.
                                                                                             myeloma (MM), or rheumatoid arthritis. In addition, pharmaceutical compositions containing recombinant proteins may be used to treat or

The present sequence is that of a human macrophage specific FCRI, as deduced from cDNA clone p135 (see A50592), which was isolated from a cDNA library expressed in COS cells using a novel method of the invention designed to isolate CSA nucleic acids. The method is based upon transient expression of a CSA in eukaryotic cells and

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                      Score

-I- FUNCTION: ACCESSORY PROTEIN FOR MHC CLASS-II ANTIGEN/T-CELL RECEPTOR INTERACTION. MAY REGULATE T-CELL ACTIVATION.
-I- SUBUNIT: ASSOCIATES WITH P56-LCK (BY SIMILARITY).
-I- SUBCELLULAR LOCATION: TYPE I MEMBRAME PROTEIN.
-I- SUBCELLULAR LOCATIONS TO THE IMMUNOGLOBULIN SUPERFAMILY. CONTAINS ONE V-LIKE AND 3 C2-LIKE DOMAINS.
